ASSISTIVE TECHNOLOGY

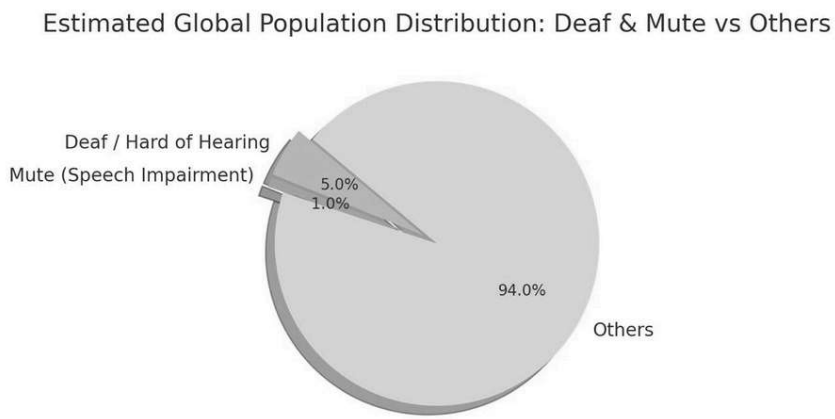
for Sign Language Translation

Introduction

Assistive Technology refers to tools and applications that support people with disabilities, improving accessibility and inclusion.

Do you know ?

That around 6% of the world's population are deaf or have speech impairments, making assistive technology essential for better communication and inclusion.



What do you think there problem is ?

Millions of deaf and hard-of-hearing people struggle to communicate daily, since sign language is not understood by most of society.

Our solution

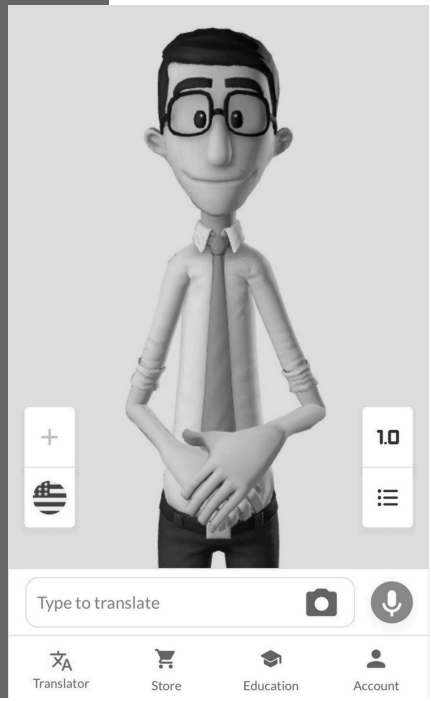
hand talk

A global free app that translates text and speech into sign language using a 3D avatar. Available in Portuguese and English.

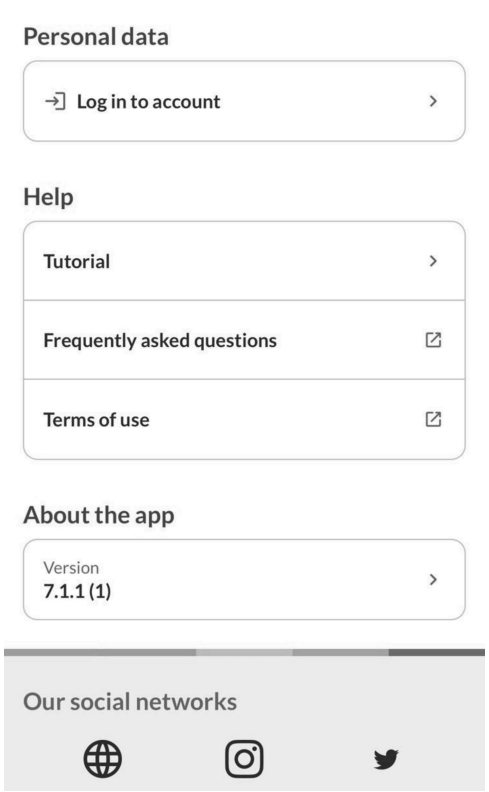
Tarjuman

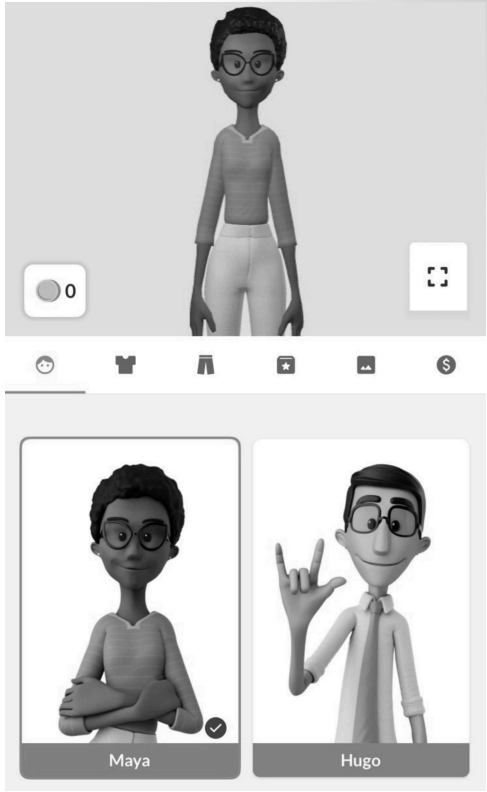
An Arabic app that used AR avatars to translate spoken Arabic into Arabic Sign Language. It was an important local initiative, but is no longer available.

Hand talk interfac

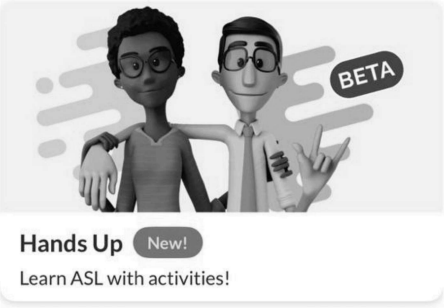


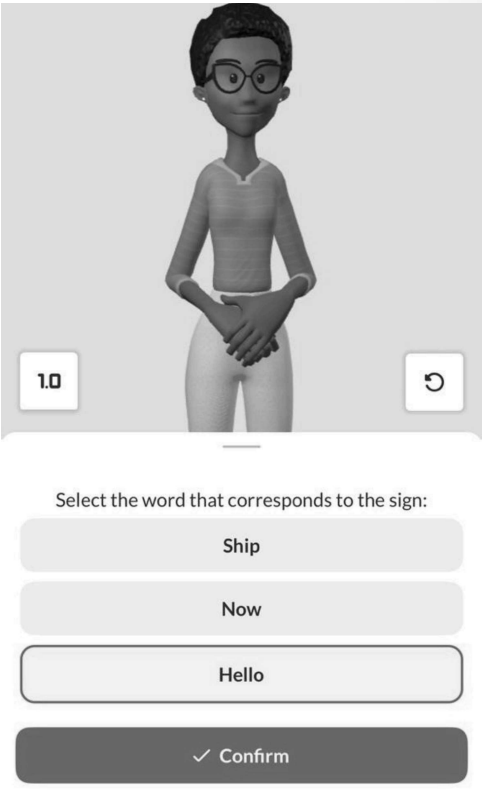
- The virtual translator character (Hugo) appears in the center to show sign language.
- A text box at the bottom lets users type or speak for instant translation.
- Options to adjust language, speed, and viewing angle.
- The interface is simple and easy to use.

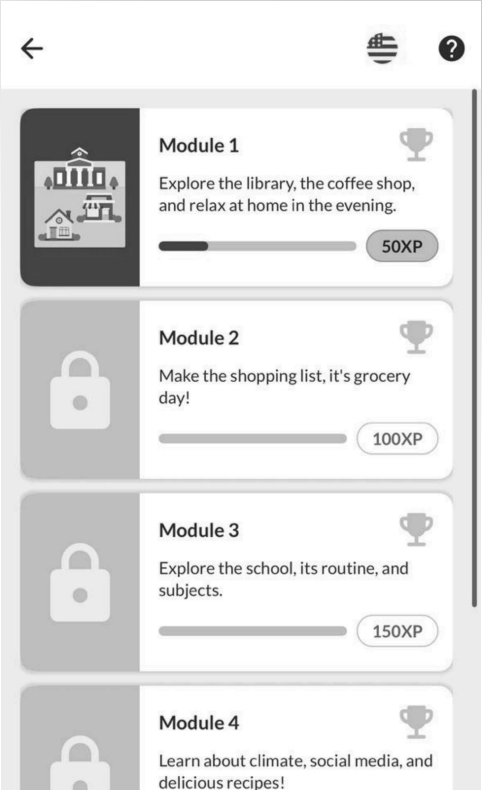




Users can create their own account and customize their virtual character





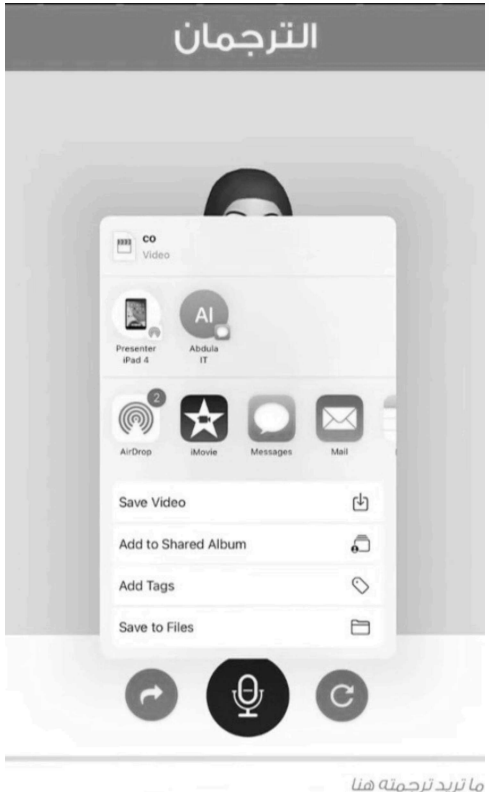


The app includes an education feature with lessons and tests

Tarjuman interface

- The app offers an Arabic-friendly interface designed to bridge communication through sign language.
- Users can create and customize their own virtual avatar that performs sign translations.
- It supports both text and speech input for real-time translation.

The design and character choices reflect Arab culture and community values.



It also allows users to share translated messages easily across platforms.
